

If entry sensor is pressed, it will send message to previous conveyor family with state=false; otherwise, send isAvailable(true);

If popup is not working, PopupRaise() is sent; if popup is working, PopupLow() is sent.

If sensor reports that the popup is not working, stopConveyor() is sent. If sensor receives that popup continues to work, StartConveyor() is sent.

If popup is not available, send isPopupAvailable(true); otherwise, send isPopupAvailable(false). Same thing applies to isAvailable(boolean) message.
